

Amersham™ Hybond LFP 0.2 PVDF Western blotting membrane

Low-fluorescent, hydrophobic PVDF protein blotting membrane with 0.2 µm pore size.

DOMINIQUE DUTSCHER SAS

Overview

Low-fluorescent, hydrophobic PVDF protein blotting membrane with 0.2 µm pore size.

- Much lower background fluorescence than other commercially available PVDF membranes, resulting in higher sensitivity.
- Protein binding capacity over 200 µg/cm2.
- Compatible with a variety of blocking agents, transfer buffers, and total protein blot stains.
- Available in popular precut sizes for laboratory applications.

Low background fluorescence

Amersham Hybond LFP 0.2 PVDF is a low-fluorescent, hydrophobic membrane, with 0.2 µm pore size, for protein transfer. Amersham Hybond LFP is optimized for fluorescent detection in Western blotting applications and for use with the Amersham ECL Plex detection system. This membrane has low background fluorescence, resulting in high sensitivity. Typical protein binding capacity is > 200 µg/cm2.
The PVDF protein blotting membrane, with 0.2 µm pore size, provides low auto-fluorescence across a wide range of excitation/emission wavelengths.

Western blotting sandwiches

For convenience, Western blotting sandwiches (10 sandwiches/package) are available, consisting of precut Amersham Hybond LFP 0.20 PVDF membranes preassembled with 2 x 3 mm Chr blotting papers.
